# HRD — Horse Real-Time Data

EFM API key collection & platform brief | Version 1.0 | 12 October 2026

**IMPORTANT 1: Do NOT ask this in the EIRS group. Ask it directly in the LookAround Team B group only.**

**IMPORTANT 2: Do not inform anyone else in the group. This project is confidential.**

## 1. Objective

Fetch all API keys and API routes from EFM for the club currently under LookAround, and connect them to one internal website, HRD, that shows food, employees, clubs and horses in real time. Every future club that joins LookAround gets its own key attached to HRD in the same way. At present there is one club.

## 2. Fetching the EFM API keys

- Request the keys from the EFM account owner or admin of the club, using the club's own EFM login. Record who issued each key and when.
- Collect, per club: base URL, API key / token, scopes granted, rate limits, and the list of available routes (food, employees, horses, club info).
- Confirm the key's scope is read-only for this phase. Ask for write access only if a later feature needs it.
- Confirm that the club's written approval and the EFM terms of service allow using the key from a third-party system. If EFM requires notification of integrations, follow it.
- Store keys only in server-side environment variables or a secrets manager. Never in the browser, in source code, in chats or in screenshots.
- Rotate any key that has been pasted in a chat or shared by email.

## 3. Authentication (phase 1)

- Single role: **Admin**. No other users, no sign-up.
- Login by phone number + OTP. The OTP is hard-coded for now (prototype only). The site is demo-only until real auth is in place.
- Phase 2: replace with Google Sign-In (OAuth), restricted to an allow-list of admin emails, with sessions and audit logging.
- Before any real data goes live: move the OTP check to the server, add attempt limits, and never ship the hard-coded OTP to production.

## 4. Website structure (white / red / black, no logos)

| Sidebar tab | What it shows |
|---|---|
| Food | All EFM food items: stock, quantity consumed, quantity added, and usage pulled from EFM, with date range. |
| Employees | All employees with role, contact details, club, joining date, status and any EFM profile fields. |
| Organizations / Clubs | Each club with a short brief: employee count, horse count, active key status, last sync. |
| Horses | Every horse in EFM with all menu details per category: profile, health, feed plan, training, owner, stable, documents. |
| Entity Map | An EFM-style map per club linking club → employees → horses → food, with one view per club. |
| API Routes | Every API route available for each club, with method, status and last response time. Key values are masked. |

## 5. Data model

| Entity | Key fields | Source (EFM route) |
|---|---|---|
| Club | id, name, employees, horses, key status, last sync | /clubs (to confirm) |
| Employee | id, name, role, phone, email, club, status, joined | /employees (to confirm) |
| Horse | id, name, breed, age, sex, owner, stable, health, feed plan, training, docs | /horses (to confirm) |
| Food item | id, name, unit, stock, added, consumed, used (EFM) | /feed, /inventory (to confirm) |

Route names above are placeholders. The real ones come from the EFM API documentation provided with each key.

## 6. Multi-club onboarding

- Admin adds a club in HRD: name, EFM base URL, API key. The key is encrypted on the server and shown masked afterwards.
- HRD runs a connection test, discovers the available routes and lists them under API Routes.
- Data is synced on a schedule (for example every 5 minutes) and cached, so the dashboard stays fast and EFM is not overloaded.
- The club appears in Clubs, Entity Map, Food, Employees and Horses automatically, with a club filter on each tab.

## 7. Confidentiality and security

- Treat keys, club data and this document as confidential. Share only with the people who need them for the work.
- Employee and horse-owner data is personal data. Limit access to the admin, log every login and key change, and keep a data-retention rule.
- Use HTTPS only, per-club keys (never shared between clubs), and least-privilege scopes.
- Keep a short record of who authorised each club's key, so access can be shown to be legitimate if the club or EFM ever asks.

## 8. Build plan

| Phase | Scope | Status |
|---|---|---|
| 1 | Prototype website with sample data, phone + hard-coded OTP, all six tabs | Delivered |
| 2 | Connect the real EFM key, server-side proxy, live sync, masked keys | Next |
| 3 | Google Sign-In, audit log, second club onboarding | Planned |

## 9. Checklist

- Post the request in LookAround Team B only (not EIRS).
- Receive the key, scopes and route list from the club's EFM admin.
- Get the club's written approval; check the EFM terms.
- Store the key server-side; replace sample data with live data.
- Replace the hard-coded OTP before go-live.
